Dear Bill,

With one exception your sketch is what I asked of my friend!

I do not think the swivel would be a benefit. It is easy enough to move the whole thing when it is on crazy wheels.

The actual space between my desk and the window is but 34". So I have to move the whole thing to get in or out.

In fact, the swivel might make a problem.

It is because there is ^{so} little space that I think the table ^{and ball} should not be any larger than it now ^{they are} is.

I do not think the adjustment should go to anywhere near 15". It should be the present height at the maximum and perhaps ^a six or more ^{e/} settings that are lower.

If a bolt were used instead of a pin and had a wing nut it would I think be better for me. And the chain is not a good idea. My legs will hit it and that will tear the supports I have to wear.

The tilt would not help and might be a disadvantage. Besides being more work.

If you make a whole new stand, that would be fine, but please remember how friable my skin is and have no rough edges as from plywood. I peel a bit of skin on my right shin back last evening with a washcloth!

I appreciate the time you are giving this and whatever you may do!

I've heard again from a Florida friend who says there is no ASK95 but he is going to Dallas anyway to see an elderly friend. He is a retired man.

Our thanks and best wishes,

Hawley
